Peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 105
                                                                                                                                                                    of the printed
                                                                                                                                                                                                                                                                                                                                                                                                     65
                                                                                                                                   Note: The sequence data for this patent did not form part of the printer specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cytokine; cell proliferation; cell differentiation; gene therapy; stem cell growth factor; haematopoiesis; growth factor; haematopoiesis; growth factor; immunomodulatory; cancer; leukaemia; system disorders; arthritis; inflammation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity tissue growth factor activity, immunomodulatory activity and activity inhibin activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     form part of the printed

AAH32943 to AAH37195 and AAG73514 to AAG77788 represent human colon cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene cancer antigens have cytostatic activity and can be used in gene production. N and P may be used in the prevention, characters and treatment of diseases associated with decreased expression by rectifying mutations or deletions associated with decreased expression by rectifying mutations or deletions associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing in a patient's genome that affect the activity of P by expressing in a patient or to supplement the patients own production of P. Maditionally, N may be used to produce the colon cancer-associated Ps. Additionally, N may be used to produce the colon cancer-associated Ps. C. to express the proteins. N and P can be used in the prevention, diagnosis and AAB77789 represent sequences used in the exemplification of the present invention.

Or have an appear of the process of the sequence listing were missing at time of publication.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to novel genes (AAL34669-AAL37666) and proceed to associated with the musculoskeletal system (ABB03087-ABB04109) associated with the musculoskeletal system for preventing, treating or ameliorating medical conditions e.g. protein or gene therapy. The genes are isolated from a range of protein or gene therapy. The genes are useful in the diagnosis, treating antibodies and (ant)agonists are useful in the diagnosis, treating prevention of: (a) cancer, e.g. breast and ovarian cancer and prevention of: (a) cancer, lung, or urogenital; (b) immune cher cancers e.g. Addison's disease, allergies, autoimmune haemoly discorders e.g. Addison's disease, allergies, autoimmune haemoly cancernia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, and ilitus, Crohn's disease, correlation and lections diseases e.g. cerebral anoxia and epic healing; (e) neurological diseases e.g. cerebral anoxia and epic parasitic infections.

C parasitic infections diseases such as viral, bacterial, fungal and (f) infections diseases such as viral, bacterial, fungal and printed specification, but was obtained in electronic format disconting wipo at ftp.wipo.int/pub/published_pct_sequences.

The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and parasitic infections.
                                                                                                                                                                                                                                                                acids encoding 3224 human nervous system antigen polypeptides, or preventing, diagnosing and/or treating nervous system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    chimera; cDNA library preparation; serotonin;
                                                                                                                                                                                                                                                                                                                  Claim 11; SEQ ID NO 6614; 1701pp + Sequence Listing; English.

                                                                                                                                                                                    The present sequence is mouse G-protein coupled receptor (GPCR) RP-23 protein. RP-23 is a ligand for sphingosine-1-phosphate (sphingosine-1-PO4) which is formed by the breakdown of sphingolipids and is involved in cell signalling. Sphingosine-1-PO4 causes an increase in intracellular calcium concentration. The present invention relates to methods for determining whether a test compound modulates interactions between sphingosine-1-PO4 and RP-23 a particular G-protein coupled receptor. The method is useful for determining a modulator which binds sphingosine-1-PO4 to an RP-23 receptor. The compounds identified are useful as thereapeutic agents for treating cardiovascular diseases,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             53
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              87
                                                            Determining modulator of binding of sphingosine-1-PO4 to RP-23 receptor, involves incubating sphingosine-1-PO4 and RP-23 receptor with test compound, determining the binding and comparing with a control
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; G-protein coupled receptor; GPCR; transgenic animal; receptor;

The invention relates to a non-human transgenic animal having targetted G-protein coupled receptor (GPCR) gene disruptions in melanocortin-3 gene 5-HT-2B gene, chemokine receptor 9A gene, glucocorticoid-induced receptor gene, orphan GPR10 (UHR)-1) gene, orphan GPR14 gene, orphan GPR15 gene, beta chemokine receptor (EDI) gene, endothelial differentiation GPCR3 (EDG3) gene, ATP receptor P2UI gene or adenosine 3 receptor gene. The transgenic animal is useful for identifying an agent that ameliorates a phenotype associated with a disruption in the target gene. A transgenic construct is useful for producing a transgenic animal, an efficacy of proposed genetic and pharmacological therapies for human genetic diseases, such as neurological, neuropsychological or psychotic illnesses. The transgenic animal is also useful as models for diseases, disorders or conditions associated with phenotypes relating to a disruption in a target, and to identify pharmaceuticals, therapies, drugs and interventions which may be effective in treating a disease or other phenotypic characteristics of the animal. An agent which modulates the expression of the target gene is useful as a therapeutic for treating conditions associated with a disruption of the target gene is useful as a therapeutic for treating sequence is human glucocorticoid-induced receptor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              327

```
The present protein sequence is the non-endogenous, constitutively active form of human 5-HT2C serotonin receptor. A point mutation replaces a Ser with Lys in the third intracellular loop of the 5-HT2C receptor. This activated receptor allows linkage to the transduction pathway and produces a biological response. This sequence can be used to identify antagonists that bind serotonin receptors and reduces the baseline intracellular response caused by receptor activation. Constitutive expression of this receptor is suitable for drug screening and to identify agents of very high specificity. These compounds are potentially useful for treating or preventing disorders involving central nervous system and cardiovascular, gastric or inflammatory disorders, that

The invention relates to constitutively active, non-endogenous versions of endogenous human orphan G protein-coupled receptors (GPCRs, AAY90643-AAY90677 and AAY90683-Y90687), and to DNA encoding them (AAA30709-A30743 and AAA30775-A30779). The mutant proteins of the invention contain a mutation in a portion of the protein comprising intracellular loop 3 (IC3) and transmembrane domain 6 (TW6). A non-endogenous amino acid, X, is substituted for an endogenous residue in IC3 at a position 16 amino acids N terminal of an endogenous proline in TM6 to form a sequence X-(AA)15-Pro. The endogenous residue in IC3 at a position 16 amino acids of preferably Lys. When the endogenous residue at this or IA4, and is preferably Lys. When the endogenous residue at this position is Lys, this residue is replaced by His, Arg or preferably Ala. The 15 amino acid stretch between the substituted amino acid and the Promacon andogenous residues. The constitutively active GPCRs are useful for identifying antagonists, agonists and partial agonists for use as the conditions. Antagonists for a particular GPCR are useful for treating diseases and disorders associated with that receptor. Because the novel mutant GPCRs are constitutively active, they can be used directly for screening of compounds without the need for endogenous injudies. Sequences AAY90677 and AAY90683-Y90687 the mutant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         328

This invention describes novel 1-Phenyl-3-(3-(4-bromo-3-pyrazolyl)phenyl)
-urea derivatives (I) which are modulators of non-endogenous,
constitutively activated forms of serotonin 5-HT2A (and 5-HT2C) receptors
and inverse agonists to 5-HT2A receptors. (I) modulate serotonin 5-HT(2A)
receptor activity and are potentially useful for treating central nervous
system (CNS), gastrointestinal, cardiovascular and inflammatory
                                                                                                                                  agonist;
modulator;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New 1-phenyl-3-(3-(4-bromo-3-pyrazolyl)phenyl)-urea derivatives, usefu as 5-HT(2A) receptor ligands e.g. for treating central nervous system, gastrointestinal, cardiovascular and inflammatory disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RNTAEEENSANPNODONARRKKKERRPRGTMQAINNERKAKKVLGIVFFVFLIMMCPFF

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          combination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         full-length

                                                                                                                                                                                                                                                                                                                                                                                                      Yamamoto
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sequence and an oligonucleotide comprising a sequence compleme sequence and an oligonucleotide comprising a sequence compleme polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the compt the 5'-end sequence/3'-end sequence is selected from those def the specification. The primer sets can be used in antisense the in gene therapy. The primers are useful for synthesising polyn particularly full-length cDNAs. The primers are also useful for detection and/or diagnosis of the abnormality of the proteins the full-length cDNAs. The primers allow obtaining of the full cDNAs easily without any specialised methods. AAH03166 to AAH13633 to AAH18742 represent human cDNA sequences; AAH03166 to AAH13639 represent human amino acid sequences; and AAH13629 to represent oligonucleotides, all of which are used in the exemp of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ins

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ABN15762 to ABN27252 encode the human ORFX treating or preventing a pathology associated with an ORFX-associated disorder. In humans, and in the manufacture of a medicament for treating a capuences can be used in gene therapy. ORFX sequences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumnours, keloid, degenerative disorders, haemorrhage, osteoarthritis, neurodegenerative disorders, disorders related to organ transplantation, cardiovascular diseases, diabetes mellitus, systemic lupus erythematosus, hypertension, hypothyroidism, cholesterol ester storage disease, various immune deficiencies and disorders, infectious diseases and autoimmune thyroiditis, myasthenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. ORFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis, bone degenerative disorders, or periodontal disease, and for gut protection or regeneration and treatment of lung or liver fibrosis, reperiodon injury in various tissues and conditions resulting from Human; open reading frame; ORFX; gene therapy; cancer; cirrhosis; hyperproliferative disorder; psoriasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardiovascular disease; diabetes mellitus; systemic lupus erythematosus; hypertension; hypothyroidism; cholesterol ester storage disease; immune deficiency; immune disorder; infectious disease; autoimmune disorder; rheumatoid arthritis; autoimmune thyroiditis; the printed ot form part of the printer format directly from WIPO Novel human polypeptides and polynucleotides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and autoimmune disorders ö Length 81; Indels 12; sequence data for this patent did not ion, but was obtained in electronic for 23; SEQ ID NO:1014. ftp.wipo.int/pub/published_pct_sequences Score 67; DB Pred. GENERAL INFORMATION:

APPLICANT: Behan, Dominic

APPLICANT: Chalmers, Derick

TITLE OF INVENTION: Human Serotonin Receptors and Small Molecule Modulators

NUMBER OF SEQUENCES: 33

CORRESPONDENCE ADDRESS:

ADDRESSEE: Arena Pharmaceuticals, Inc.

STREET: 6166 Nancy Ridge Drive

CITY: San Diego
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           3;

GENERAL INFORMATION:

APPLICANT: Behan, Dominic

APPLICANT: Chalmers, Derick

TITLE OF INVENTION: No. 6420541-Endogenous, Constitutively Activated Hu

TITLE OF INVENTION: Serotonin Receptors and Small Molecule Modulators

TITLE OF INVENTION: Thereo

FILE REFERENCE: AREN0035

CURRENT APPLICATION NUMBER: US/09/767,013

CURRENT FILING DATE: 2001-01-23

PRIOR FILING DATE: 1999-04-14

Sequence 15, Application US/09215694B

Patent No. 6391583

GENERAL INFORMATION:

APPLICANT: Wisconsin Alumni Research Foundation

APPLICANT: Hutchinson, Charles R.

APPLICANT: Kennedy, Jonathan n.m.i

APPLICANT: Kennedy, Jonathan n.m.i

TITLE OF INVENTION: METHOD OF PRODUCING ANTIHYPERCHOLESTEROLEMIC AGEI

FILE REFERENCE: 960296.95718

CURRENT APPLICATION NUMBER: US/09/215,694B

CURRENT FILING DATE: 1999-12-18

NUMBER OF SEQ ID NOS: 36

SOFTWARE: Patentin Ver. 2.0

SEQ ID NO 15

LENGTH: 488

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Functional expression in yeast and characterization of a inducible plant cytochrome P-450 (CYP94A1) involved in cut; synthesis."; Biochem. J. 332:583-589(1998).

-!- FUNCTION: Catalyzes the omega-hydroxylation of various (FA) from 10 to 18 carbon atoms. The substrate specific higher for laurate > palmitate > myristate > linolenate linoleate > oleate > caprate. May play a minor role in synthesis and could be involved in plant defense.

                                                                                                            TISSUE SPECIFICITY: At the gastrula stage, exclusively expressed in the mesodermal layer and at the neurula stage in the lateral plate mesoderm. Larval expression is observed in the endothelium of the primary blood vessels and the forming heart.

DEVELOPMENTAL STAGE: First expressed at the late blastula stage, increases during gastrulation and remains constant between neurula
                                                                 FUNCTION: Putative receptor for an apelin-like peptide coupled to G proteins that inhibit adenylate cyclase activity.

SUBCELLULAR LOCATION: Integral membrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                   -!- SUBUNIT: HOMODIMER (PROBABLE).
-!- ALTERNATIVE PRODUCTS: AT LEAST TWO FORMS MAY BE PRODUCED BY
ALTERNATIVE SPLICING OF THE SAME GENE.
-!- TISSUE SPECIFICITY: FOUND IN THE HARD KERATINIZING TISSUES SUCH AS
THE INNER ROOT SHEATH (IRS) OF HAIR FOLLICLES AND MEDULLA, AND IN
THE EPITHELIA OF THE TONGUE, HOOF AND RUMEN.
-!- DOMAIN: CONSISTS OF NINE DOMAINS. DOMAIN 1 CONTAINS TWO EF-HAND
CALCIUM-BINDING DOMAINS. DOMAINS 2-4, 6, AND 8 ARE ALMOST
ENTIRELY ALPHA-HELICAL, CONFIGURED AS A SERIES OF PEPTIDE REPEATS
OF VARYING REGULARITY, AND ARE THOUGHT TO FORM A SINGLE-STRANDED
ALPHA-HELICAL ROD STABILIZED BY IONIC INTERACTIONS.
THE MOST REGULAR AND MAY BIND KIF DIRECTLY BY IONIC INTERACTIONS
THE MOLECULE. DOMAIN 9 CONTAINS THE C-TERMINUS, CONSERVED AMONG

                                                                                                                                                                                                                                                               FUNCTION: INTERMEDIATE FILAMENT-ASSOCIATED PROTEIN THAT ASSOCIATES IN REGULAR ARRAYS WITH KERATIN INTERMEDIATE FILAMENTS (KIF) OF THE INNER ROOT SHEATH CELLS OF THE HAIR FOLLICLE AND THE GRANULAR LAYER OF THE EPIDERMIS. IT LATER BECOMES CROSS-LINKED TO KIF BY ISODIPEPTIDE BONDS. IT MAY SERVE AS SCAFFOLD PROTEIN, TOGETHER WITH INVOLUCRIN, IN THE ORGANIZATION OF THE CELL ENVELOPE OR EVEN ANCHOR THE CELL ENVELOPE TO THE KIF NETWORK. IT MAY BE INVOLVED IN ITS OWN CALCIUM-DEPENDENT POSTSYNTHETIC PROCESSING DURING TERMINAL DIFFERENTIATION.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SUES SUCH AS

"Four 5-hydroxytryptamine7 (5-HT7) receptor isoforms in hu
produced by alternative splicing: species differences due
intron-exon organization.";
J. Neurochem. 68:1372-1381(1997).
FUNCTION: Acad. Sci. U.S.A. 99:996-1001(2002).

FUNCTION: Converts holo-ACP to apo-ACP by hydrolytic class phosphopantetheine prosthetic group from ACP (By State of Activity: Holo-[acyl-carrier protein] + H(2)(phosphopantetheine + apo-[acyl-carrier protein].

SIMILARITY: BELONGS TO THE ACPD FAMILY.

                                                                                             SUBCELLULAR LOCATION: Integral membrane protein.

ALTERNATIVE PRODUCTS: 3 ISOFORMS; D (SHOWN HERE), A AND B; ARE PRODUCED BY ALTERNATIVE SPLICING. ISOFORM D IS THE LONGEST ISOFORM BUT ISOFORMS A AND B APPEAR TO BE EXPRESSED AT HIGHER LEVELS.

TISSUE SPECIFICITY: ISOFORM A IS THE PREDOMINANT ISOFORM IN SPLEEN, CAUDATE AND HIPPOCAMPUS. ISOFORM B IS EXPRESSED AT LOWER LEVELS, AND ISOFORM D IS A MINOR ISOFORM.

SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
FUNCTION: THIS IS ONE OF THE SEVERAL DIFFERENT RECEPTORS FOR 5-HYDROXYTRYPTAMINE (SEROTONIN), A BIOGENIC HORMONE THAT FUNCTIONS AS A NEUROTRANSMITTER, A HORMONE, AND A MITOGEN. THE ACTIVITY OF THIS RECEPTOR IS MEDIATED BY G PROTEINS THAT STIMULATE ADENYLATE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (POTENTIAL)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               poliovirus polyprotein. In other picornavirus reactions Glu masubstituted for Gln, and Ser or Thr for Gly.

CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Duechler M., Skern T., Sommergruber W., Neubauer C., Gruendler P Fogy I., Blaas D., Kuechler E.; "Evolutionary relationships within the human rhinovirus genus: comparison of serotypes 89, 2, and 14."; Proc. Natl. Acad. Sci. U.S.A. 84:2605-2609(1987).

-!- FUNCTION: P3C POLYPEPTIDE IS A PROTEASE THAT CLEAVES AT CERTY Q/G SITES IN THE POLYPROTEIN. IT MAY BE A CYSTEINE PROTEASE.

-!- CATALYTIC ACTIVITY: Selective cleavage of Gln-|-Gly bond in poliovirus polyprotein. In other picornavirus reactions Glu r substituted for Gln, and Ser or Thr for Gly.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          {RNA}(N).
